Oilseeds Annual Report

2007

Approved by:
Lisa Anderson
U.S. Embassy

Prepared by:
Darlene Dessureault

Report Highlights:
Total Canadian oilseed production during 2007/2008 is forecast to marginally increase due to off-setting increase and decreases in canola and soybean production, respectively. Prairie farmers seem optimistic about the crop year as summer fallow intentions on March 31, 2007 stood at 3.3 million hectares, a drop of 25% from the previous year. A series of good news announcements by the federal government including new monies for farmers and a renewable fuel content mandate may be influencing planting decisions. Large carry-in stocks and increased production are expected to enable total Canadian canola exports to exceed 2006/2007 levels. U.S. exports of soybean meal to Canada are currently projected to remain steady in 2007/2008 as hog producers turn to soy meal instead of corn due to rising costs of the latter.

Executive Summary

Summary: Total Oilseeds

On balance, total Canadian oilseed output during 2007/08 is forecast to reach about 12.9 million metric tons (MMT), a slight increase from the 12.8 million metric tons produced a year earlier. An 8% increase in canola production is expected to be offset by a 17% decrease in soybean production.

In late April 2007, Statistics Canada reported that canola producers intended to plant 12% more hectares than last year. Statistics Canada's March planting intentions survey indicates that soybean producers will plant 4% less acreage in 2007/08 as corn competes with soybeans for acreage.

Canadian sunflower production is forecast to decrease by 17% in 2007/08, but the small decrease in tonnage will not be enough to significantly offset the marginal production increases of the major oilseeds.

Summary: Total Meals

Total oilseed meal production in Canada (canola and soybean) in 2007/08 is forecast to reach 3.42 MMT, a 5% increase from the previous year's levels of 3.26 MMT. High carry-in stocks of soybeans in 2007/2008 offset the expected reduction in production and, by drawing on stocks, soybean meal production is expected to increase by 5% over 2006/2007 levels. Increased production of canola meal and high carry-in stocks resulting from high canola yields in 2006/2007 are expected to lead to an 5% production increase for canola meal in 2007/2008.

Canada is a net exporter of canola meal and a net importer of soybean meal. Canola meal exports are expected to rise in 2007/2008 due to increased supplies resulting from high carry-in stocks and increases in production. Most will likely go to the U.S. market where it is used in dairy rations. Soybean meal imports from the U.S. are expected to remain steady as hog producers prefer the lower soybean prices to the higher corn prices that are being driven up by the corn demand of the expanding ethanol industry.

Summary: Total Oils

Total Canadian production of oil from oilseeds in 2007/2008 is expected to increase by 1.3%. This increase is due almost entirely to the increase in canola production. Exports for canola look strong for 2007/2008 reflecting the available supplies and the strong demand for rapeseed oil by the United States and to Pacific Rim markets.

Quality Reports

Much of the responsibility for the quality of Canadian grain and oilseeds entering domestic and international markets belongs with the Canadian Grain Commission (CGC). The CGC annually publishes "Harvest Reports". These reports describe the quality of Canadian oilseeds surveyed from the annual harvest in the Prairie Provinces and in Ontario. For example, the 2006 harvest report for canola reports that the western Canadian canola crop was significantly above average in oil content and below in protein content. The report attributes this to good moisture conditions at the start of the growing season plus relatively cool evenings in much of the western Canada canola growing area. For soybeans, the 2006 harvest report indicates that the top two grades of soybeans are well above their ten-year average for oil content but below their ten-year average for protein content. More information can be found at: http://www.grainscanada.gc.ca/Quality/crop_qual-e.htm

Canola (Rapeseed)

For 2007/2008, Canadian prairie farmers have indicated that they may be seeding a record area of canola and field peas, and less spring wheat and flaxseed. According to Statistics Canada's March Seeding Intentions Survey (published April 24th), canola area will rise to 6.0 million hectares, an increase of nearly 12% over last year's seeding. In contrast, spring wheat planting intentions have fallen almost 16% to 6.9 million hectares and flaxseed planting intentions are decreased more than 30% over the previous year to 579 thousand hectares.

Although still high, canola yields fell slightly in 2006/2007 from the historic highs reached in 2005/2006 of 1.83 t/ha. Crop analysts expect canola yields in 2007/2008 to be more in line with normal yield averages of 1.66 t/ha.

Agricultural producers may be feeling more optimistic in comparison to last year's survey, which may account for the significant drop in summer fallow intentions. Summer fallow intentions at March 31, 2007 stood at 3.3 million hectares, a drop of 25% compared to 2005 levels. A series of good news announcements by the federal government in the form of a renewable fuels mandate, a renewable fuels strategy, and new monies for farmers is likely influencing planting decisions. Of the three Prairie provinces, Saskatchewan is reporting the greatest increase in canola seeding intentions with a reported increase of 405 thousand hectares to a record 3 million hectares. Despite the increased input costs for canola relative to other crops, a new health accreditation from the FDA in the United States and movement on a biodiesel mandate (which had been flat for several years), and a dynamic biofuel strategy in the U.S. could be responsible for an optimistic outlook for canola returns.

Crush Capacity Utilization

According to the Canadian Oilseed Processors Association, the utilization of canola crush capacity in Canada over calendar year 2006 increased nearly 11% over year 2005 levels:

2002 Jan-Dec 53.8%
2003 Jan-Dec 67.4%
2004 Jan-Dec 84.7%
2005 Jan-Dec 84.5%
2006 Jan-Dec 93.7%

Soybean

For crop year 2007/2008, Canadian soybean acreage is forecast to decrease from 2006 levels. Large area and higher than average yields in 2006/2007 contributed to the 12% production increase from 2005/2006 and will likely result in historically high carry-out stocks. For 2007/2008 crop year, Agriculture and Agri-Food Canada anticipates production to be more in line with normal yield of 2.47 t/ha.

The March 2007 planting intentions survey released by Statistics Canada show a decrease of 4.3% to 1.19 million hectares. This decrease is likely due to record levels of corn being planted in the East in response to an increased demand from the livestock industry as well as government monies being allocated to encourage the development of the ethanol industry.

Soybean acreage in Quebec is expected to decline by 2% to 193 thousand hectares while corn acreage is expected to rise 13% to nearly half a million hectares. According to Statistics Canada, Manitoba farmers indicated that they might decrease soybean plantings by more than 48.6 thousand hectares to 97.1 thousand hectares. Soybean acreage for Ontario is expected to hold at last year's levels of 890 thousand hectares.

Due to the decline in the soybean intended area, total soybean output in 2007/2008 is expected to decline by 17%, decreasing from 3.5 MMT in 2006/2007 to 3.0 MMT in 2007/2008. Lower production combined with a slight increase in domestic usage will draw soybean stocks down in 2007/2008.

Peanut

Peanut production in Canada is constrained by climatic conditions. Agriculture extension reports indicate that a minimum of 3,000 corn heat units is required for normal growth and development. Peanuts grown in areas with fewer heat units will not reach optimum maturity and generally the yield is too low to justify commercial production. As a result, minor peanut production is limited to a few farms in southern Ontario that plant in the range of 200-400 hectares. As a result, Canada is a net importer of peanuts with the United States and China being the top suppliers. For Canadian peanut trade data, see the statistical section of this report.
